

Assignment 2

Examples of EdTech application/website:

Mimo

Kahoot

Quizlet

Khan Academy

Brilliant

Yousician

Duolingo

Memory

Encoding

1. When you first encounter new material in the app, does it present it in a way that helps it stick through examples, visuals, or connecting it to something you already know or does it feel like raw information being thrown at you?
2. Do the game elements (earning points, beating a level) make you pay closer attention to the content, or do they pull your focus away from actually processing it?

Spacing & Repetition

3. Does the app bring back material you learned earlier days or weeks later or does it move forward without revisiting older content?
4. When content is repeated, does it feel like a meaningful review or just the same exercise copy-pasted?

Retrieval Practice

5. Does the app ask you to recall information from memory (e.g., answer without options visible, fill in a blank), or does it mostly ask you to recognize the right answer from choices?
6. After completing a challenge, does the app ever ask you to explain or apply what you just learned in a new context or does the interaction end once you get the right answer?

Feedback & Error Correction

7. When you get something wrong, does the app help you understand why you were wrong in a way that you remember later or do you find yourself making the same mistake again?
8. Does the feedback you receive feel timed well immediate enough to be useful, but also prompting you to think before revealing the answer?

Long-term Retention

9. If you were tested on something you learned in the app two weeks later outside the app, in a real situation how confident are you that you would still remember it?
10. Has the app ever surprised you by showing you how much you have retained over time for example, through a progress check or a challenge that revealed your own growth?

Nielson's principles

1. Visibility of System Status

When you complete an activity or earn a reward, does the app make it immediately clear what just happened and what comes next or do you ever feel unsure whether your progress was saved?

2. Match Between System and the Real World

Do the instructions, labels, and game concepts in the app feel natural and easy to understand, or do they use jargon that makes you pause or guess?

3. User Control and Freedom

If you accidentally tapped the wrong answer or entered the wrong level, could you easily undo or go back or did you feel stuck with a mistake?

4. Consistency and Standards

Have you ever been confused because a button, icon, or interaction worked differently in one part of the app than in another?

5. Error Prevention

Does the app ever let you do something by accident that you didn't intend like submitting an incomplete answer or skipping a required step without warning you first?

6. Recognition Rather than Recall

When you return to the app after a break, can you quickly pick up where you left off, or do you have to remember a lot of context on your own?

7. Flexibility and Efficiency of Use

Are there shortcuts, customization options, or ways to skip content you already know or does the app force everyone through the same path regardless of skill level?

8. Aesthetic and Minimalist Design

Have you ever felt overwhelmed by too many elements on the screen at once notifications, scores, timers, instructions competing for your attention?

9. Help Users Recognize, Diagnose, and Recover from Errors

When something goes wrong (a wrong answer, a failed submission, a loading error), does the app explain what happened and how to fix it in plain language?

10. Help and Documentation

If you were confused about how a feature works, was it easy to find guidance within the app or did you have to search outside of it (YouTube, forums, asking someone else)?

Real world problems it runs into

Engagement & Motivation

1. When you feel stuck on a challenge in the app, what do you usually do – push through, skip it, or stop using the app for a while?
2. Have you ever felt that earning points or badges stopped feeling meaningful? If so, when did that happen?

Learning Effectiveness

3. Can you think of a moment when the game elements (scores, levels, rewards) distracted you from actually learning the material?
4. How confident are you that what you practice in the app transfers to real-life situations or exams?

Access & Equity

5. Have you ever had to stop using the app mid-session because of a weak internet connection, a low battery, or a shared device? How often does this happen?

6. Are there features or content in the app that feel designed for a different kind of learner than you in terms of language, cultural references, or learning pace?

Social & Competitive Dynamics

7. Have leaderboards or comparisons with other users ever made you feel discouraged rather than motivated? What did you do?
8. If you are using the app in a classroom or group setting, does the competitive structure cause tension between students?

Trust & Long-Term Use

9. Have you ever questioned whether the app was tracking your progress accurately for example, marking something wrong that you believe was right, or not saving your work?
10. What would make you stop using this app permanently, even if you found it useful at first?

Net Promoter Score

11. How likely are you to recommend this app to a friend? (on a scale of 1 to 10 where 10 is most likely and 1 is least likely)

For scoring the 11th question, group the answers into 3 categories:

- Promoters: responses of 9 or 10, which indicate high satisfaction and strong likelihood of recommendation
- Detractors: responses of 0 to 6, which indicate dissatisfaction and likely criticism
- Passives: responses of 7 or 8, which indicate moderate satisfaction, but low likelihood of recommendation

The Net Promoter Score (NPS) is then calculated by subtracting the percentage of detractors from the percentage of promoters:

$$\text{NPS} = \frac{\text{Promoters} \times 100}{\text{Total Respondents}} - \frac{\text{Detractors} \times 100}{\text{Total Respondents}}$$

NPS can range from -100% (only detractors) to +100% (only promoters). A positive score indicates that the promoters outnumber detractors, while a negative score shows poor customer loyalty, with detractors outnumbering promoters.

The passives are included in the total number of respondents, but do not contribute to the score otherwise.
